

Internet Protocols EBU5403

The Data Link Layer Part I

Michael Chai (michael.chai@qmul.ac.uk)

Richard Clegg (r.clegg@qmul.ac.uk)

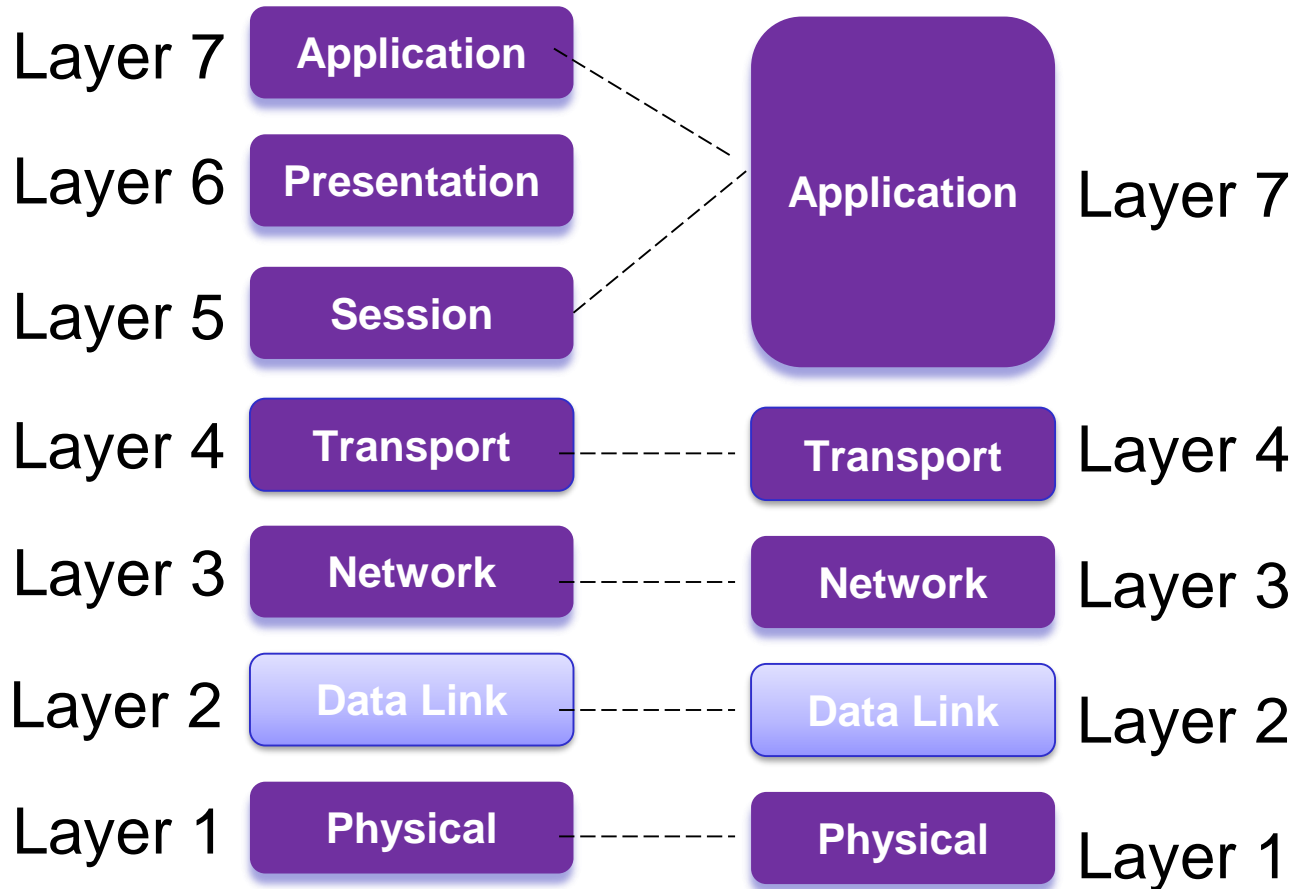

Cunhua Pan (c.pan@qmul.ac.uk)

	Week 1	Week 2	Week 3	Week 4
Group 1	Michael	Cunhua	Michael	Cunhua
Group 2	Richard			
Group 3	Michael	Cunhua	Michael	Cunhua

Structure of course

- Week 1
 - Introduction to IP Networks
 - The Transport layer (part I)
- Week 2
 - The Transport layer (part II)
 - The Network layer (part I)
 - Class test
- Week 3
 - The Network layer (part II)
 - The Data link layer (part I)
 - Router lab tutorial (assessed lab work after this week)
- Week 4
 - The Data link layer (part II)
 - Network management and security
 - Class test

Data Link Layer

Link layer, LANs: outline

6.1 introduction, services

6.2 error detection,
correction

6.3 multiple access
protocols

6.4 LANs

- addressing, ARP
- Ethernet
- switches
- VLANs

6.5 link virtualization:
MPLS

6.6 data center
networking

6.7 a day in the life of a
web request

Link layer: introduction

terminology:

- hosts and routers: **nodes**
- communication channels that connect adjacent nodes along communication path: **links**
 - wired links
 - wireless links
 - LANs
- layer-2 packet: **frame**, encapsulates datagram

data-link layer has responsibility of transferring datagram from one node to *physically adjacent* node over a link

Link layer: context

- datagram transferred by different link protocols over different links:
 - e.g., Ethernet on first link, frame relay on intermediate links, 802.11 on last link
- each link protocol provides different services
 - e.g., may or may not provide rdt over link

transportation analogy:

- trip from Princeton to Lausanne
 - limo: Princeton to JFK
 - plane: JFK to Geneva
 - train: Geneva to Lausanne
- tourist = **datagram**
- transport segment = **communication link**
- transportation mode = **link layer protocol**
- travel agent = **routing algorithm**

Link layer services

- *framing, link access:*
 - encapsulate datagram into frame, adding header, trailer
 - channel access if shared medium
 - “MAC” addresses used in frame headers to identify source, destination
 - different from IP address!
- *reliable delivery between adjacent nodes*
 - we learned how to do this already (transport layer)!
 - seldom used on low bit-error link (fiber, some twisted pair)
 - wireless links: high error rates
 - *Q:* why both link-level and end-end reliability?

Link layer services (more)

- *flow control:*
 - pacing between adjacent sending and receiving nodes
- *error detection:*
 - errors caused by signal attenuation, noise.
 - receiver detects presence of errors:
 - signals sender for retransmission or drops frame
- *error correction:*
 - receiver identifies *and corrects* bit error(s) without resorting to retransmission
- *half-duplex and full-duplex*
 - with half duplex, nodes at both ends of link can transmit, but not at same time

Where is the link layer implemented?

- in each and every host
- link layer implemented in “adaptor” (aka *network interface card* NIC) or on a chip
 - Ethernet card, 802.11 card; Ethernet chipset
 - implements link, physical layer
- attaches into host's system buses
- combination of hardware, software, firmware

Link layer, LANs: outline

6.1 introduction, services

6.2 error detection,
correction

6.3 multiple access
protocols

6.4 LANs

- addressing, ARP
- Ethernet
- switches
- VLANs

6.5 link virtualization:
MPLS

6.6 data center
networking

6.7 a day in the life of a
web request

Error detection

EDC= Error Detection and Correction bits (redundancy)

D = Data protected by error checking, may include header fields

- Error detection not 100% reliable!
 - protocol may miss some errors, but rarely
 - larger EDC field yields better detection and correction

Parity checking

single bit parity:

- detect single bit errors

two-dimensional bit parity:

- detect and correct single bit errors

1	0	1	0	1	1
1	1	1	1	0	0
0	1	1	1	0	1
0	0	1	0	1	0

no errors

1	0	1	0	1	1
1	1	1	1	0	0
0	1	1	1	0	1
0	0	1	0	1	0

parity error

*correctable
single bit error*

* Check out the online interactive exercises for more examples: http://gaia.cs.umass.edu/kurose_ross/interactive/

Internet checksum (review)

goal: detect “errors” (e.g., flipped bits) in transmitted packet
(note: used at transport layer only)

sender:

- treat segment contents as sequence of 16-bit integers
- checksum: addition (1's complement sum) of segment contents
- sender puts checksum value into UDP checksum field

receiver:

- compute checksum of received segment
- check if computed checksum equals checksum field value:
 - NO - error detected
 - YES - no error detected.
But maybe errors nonetheless?

Real systems: Cyclic Redundancy Check (CRC) algorithm has good protection against bursts of errors.

What have we learned?

- Data link layer has responsibility of transferring datagram from one node to physically adjacent node over a link.
- Key topics we learnt in this part:
 - Data link services: framing, link access and reliable delivery between adjacent nodes.
 - Error detection methods: Error Detection and Correction, Parity Check and Cyclic Redundancy Check.
